gag polyprotein - Moloney murine leukemia virus
N.Contains: core protein p15; core shell protein p30; inner coat protein p12;
C;Species: Moloney murine leukemia virus
A;Note: host Mus sp. (mouse)
C;Date: 01-Sep-1981 #sequence_revision 27-Nov-1985 #text_change 24-Jul-1997
C;Accession: A03930
R;Shinnick, T.M.; Lerner, R.A.; Sutcliffe, J.G.
Nature 293, 543-548, 1981
A;Title: Nucleotide sequence of Moloney murine leukaemia virus.
A;Reference number: A93265; MUID:82035843; PMID:618994
A;Accession: A03930
A;Molecule type: genomic RNA
A;Residues: 1-538 <SHI>
A;Residues: 1-538 <SHI>

    Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     DB

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    SURCELIULAR LOCATION: Cytoplasmic. Constituent of the scaffolding of the cornified envelope.

TISSUE SPECIFICITY: Keratinocytes of epidermis and other stratified squamous epithelia.

PTM: Substrate of transplutaminase. Specific glutamines or lysines are cross-linked to keratins, desmoplakin and to inter involucrin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           European Bioinformatics Institute.                                                                                                                         -!- DEVELOPMENTAL STAGE: EXPRESSED DURING LATE DIFFERENTIATION OF THE EPIDERMIS.

-!- DOMAIN: CONSISTS OF NINE DOMAINS. DOMAIN 1 CONTAINS TWO EF-HAND CALCIUM-BINDING DOMAINS. DOMAINS 2-4, 6, AND 8 ARE ALMOST ENTIRELY ALPHA-HELICAL, CONFIGURED AS A SERIES OF PEPTIDE REPEATS OF VARYING REGULARITY, AND ARE THOUGHT TO FORM A SINGLE-STRANUED ALPHA-HELICAL ROD STABILIZED BY IONIC INTERACTIONS. DOMAIN 6 IS THE MOST REGULAR AND MAY BIND KIF DIRECTLY BY IONIC INTERACTIONS. IN THE MOST REGULAR AND MAY BIND KIF DIRECTLY BY IONIC INTERACTIONS. DOMAINS 5 AND 7 ARE LESS WELL ORGANIZED AND MAY INDUCE FOLDS IN THE MOLECULE. DOMAIN 9 CONTAINS THE C-TERMINUS, CONSERVED AMONG DIFFERENT SPECIES.
-!- PIM: SUBSTRATE OF TRANSGLUTAMINASE. SOME 200 ASGININES ARE PROBABLY CONVERTED TO CITRULLINES BY PEPTIDYLARGININE DEIMIDASE.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              HUMAN

                                                                                                                                                                                                                                                                                                                                                                                    DIFFERENTIATION.
SUBUNIT: MONOMER (Probable).
TISSUE SPECIFICITY: FOUND IN THE HARD KERATINIZING TISSUES SUCH AS
THE INNER ROOT SHEATH (IRS) OF HAIR FOLLICLES AND MEDULLA, AND IN
THE FILLFORM PAPILLAE OF DORSAL TONGUE EPITHELIUM (PROBABLE).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   IN REGULAR ARRAYS WITH KERATIN INTERMEDIATE FILAMENTS (KIF) OF THE INNER ROOT SHEATH CELLS OF THE HAIR FOLLICLE AND THE GRANULAR LAYER OF THE EPIDERMIS. IT LATER BECOMES CROSS-LINKED TO KIF BY ISODIPEPTIDE BONDS. IT MAY SERVE AS SEPFOLD PROTEIN, TOGETHER WITH INVOLUCRIN, IN THE ORGANIZATION OF THE CELL ENVELOPE OR EVEN ANCHOR THE CELL ENVELOPE TO THE KIF NETWORK. IT MAY BE INVOLVED IN TITS ONN CALCIUM-DEPENDENT POSTSYNTHETIC PROCESSING DURING TERMINAL
                                                                                           SIMILARITY:

IP PTM: PHOSPHORYLATED BY CDC2; REGULATES DISSOCIATION FROM INTERNEDIATE FILAMENTS DURING MITOSIS (BY SIMILARITY).

SIMILARITY: Contains 1 actin-binding domain.

SIMILARITY: Contains 2 calponin-homology (CH) domains.

SIMILARITY: Contains 3 plectin repeate.

SIMILARITY: Contains 4 spectrin repeate.

SIMILARITY: Belongs to the plakin or cytolinker family.

CAUTION: ISOFORM 4 IS A FRAGMENT AT THE N-TERMINUS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        -

Submitted (DEC-1992) to the EMBL/GenBank/DDBJ databases.

SUBMITTED PROTEIN THAT ASSOCIATES

IN REGULAR ARRAYS WITH KERATIN INTERMEDIATE FILAMENTS (KIF) OF THE INNER ROOT SHEATH CELLS OF THE HAIR FOLLICLE AND THE GRANULAR LAYER OF THE EPIDERMIS. IT LATER BECOMES CROSS-LINKED TO KIF BY ISODIPEPTIDE BONDS. IT MAY SERVE AS SCAFFOLD PROTEIN, TOGETHER WITH INVOLUCRIN, IN THE ORGANIZATION OF THE CELL ENVELOPE OR EVEN ANCHOR THE CELL ENVELOPE TO THE KIF NETWORK. IT MAY BE INVOLVED IN ITS OWN CALCIUM-DEPENDENT POSTSYNTHETIC PROCESSING DURING TERMINALITS.
                                                                                                                                                                                        -:- JODOMAIS FOUNDALIES (FICUADADIO).
-:- TISSUES SPECIFICITY: POUND IN THE HARD KERATINIZING TISSUES SUCH AS THE INNER ROOT SHEATH (IRS) OF HAIR FOLLICLES AND MEDULLA, AND IN THE FILIFORM PAPILLAE OF DORSAL TONGUE ERPITHELIUM (PROBABLE).
-!- DEVELOPMENTAL STAGE: EXPRESSED DURING LATE DIFFERENTIATION OF THE EPIDERMIS.
-!- DOMAIN: CONSISTS OF NINE DOMAINS. DOMAIN 1 CONTAINS TWO EF-HAND CALCIUM-BINDING DOMAINS. DOMAIN 2-4, 6, AND 8 ARE ALMOST ENTIRELY ALPHA-HELICAL, CONFIGURED AS A SERIES OF PEPTIDE REPEATS OF VARYING REGULARITY, AND ARE THOUGHT TO FORM A SINGLE-STRANDED ALPHA-HELICAL ROD STABILIZED BY IONIC INTERACTIONS. DOMAIN 6 IS ALPHA-HELICAL ROD STABILIZED BY IONIC INTERACTIONS. DOMAIN 6 IS THE MOST REGULAR AND MAY BIND KIF DIRECTLY BY IONIC INTERACTIONS. DOMAIN 5 AND 7 ARE LESS WELL ORGANIZED AND MAY INDUCE FOLDS IN THE MOLECULE. DOMAIN 9 CONTAINS THE C-TERMINUS, CONSERVED AMONG DIRECTURE DOMAINS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Eukaryotā; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi;
